Human Positive Control Primer Set GAPDH-1

Catalog No: 71004

Format: 96 rxns

Background: The Human Positive Control Primer Set GAPDH-1 amplifies a 76 base pair fragment from intron 7 of the human GAPDH gene. It can be used as a positive control for RNA pol II phospho Ser2 and H3K36me3.

Contents: This control primer set contains both forward and reverse primers in 400 μ l of nuclease-free distilled water. The final concentration for each primer is 2.5 μ M.

Application Notes: Amplification should be carried out in a total volume of 20 μl, using the DNA template, 4 μl of the primer set, and 10 μl SYBR Green 2X qPCR Master mix with an annealing temperature of 58°C. For genomic DNA amplification, 12.5 ng of DNA was used as template.

Quality Control: This primer set was used to produce a single PCR product from PBMC genomic DNA using qPCR to generate an amplification curve with a Ct of fewer than 28 cycles. After amplification, melt curve analysis was performed to confirm the production of a single PCR amplicon.

Storage and Guarantee: The primers are shipped at room temperature and should be stored at -20°C upon receipt to ensure stability. This product is guaranteed for 6 months from date of receipt.

This product is for research use only and is not for use in diagnostic procedures.

Genomic Location

Image representing the relative location of the primer set amplicon within the genome, as generated by the UCSC Genome Browser.

Melt Curve

PCR product melting curves were obtained for qPCR reactions. Data is shown for triplicate PCR reactions using 12.5 ng of total DNA or water as template. The single peak corresponds to a single amplicon.

ChIP qPCR Data

ChIP performed using colon cancer cell line chromatin and an antibody to RNA Pol II p-Ser2 and subjected to qPCR with the indicated primer set. Data presented are normalized binding events per 1000 cells.
